

IN THE CLAIMS:

Please amend the claims as follows:

1. (Currently Amended) A thermal processing unit comprising:
 - a holder that holds a plurality of substrates;
 - a reaction container into which the holder is conveyed;
 - a process-gas supplying mechanism that supplies a process gas into the reaction container;
 - a heating mechanism that heats the reaction container to conduct a film-forming process to the substrates when the process gas is supplied;
 - a flow-rate-parameter table-data storing part that stores flow-rate-parameter table-data associating number-data of the substrates to be processed by one batch-process with target-data of flow-rate parameter of the process gas; and
 - a controlling unit that obtains target-data of flow-rate parameter of the process gas, depending on an actual number of the substrates to be processed by one batch-process, based on the flow-rate-parameter table-data stored in the flow-rate-parameter table-data storing part, and that controls the process-gas supplying mechanism according to the obtained target-data[[;]], and
 - wherein the target-data of flow-rate parameter are determined in such a manner that a speed of the film-forming process is uniform among a plurality of batch-processes in which the numbers of substrates to be processed are different from each other; and
 - an arrangement table-data storing part that stores arrangement table-data associating the number-data of the substrates to be processed by one batch-process with arrangement-data of the substrates on the holder is provided, and the controlling unit is adapted to obtain arrangement-data, depending on the actual number of the substrates to be processed by one batch-process, based on the arrangement table-data stored in the arrangement table-data storing part, and to cause the holder to hold the substrates according to the obtained arrangement-data.

2. (Original) A thermal processing unit according to claim 1, wherein the difference between a minimum value and a maximum value of average film-thicknesses of thin films formed on the substrates by the respective batch-processes divided by respective processing times is 0.05 nm/min.
3. (Original) A thermal processing unit according to claim 1 or 2, wherein the flow-rate parameter is a flow rate of the process gas.
4. (Original) A thermal processing unit according to claim 1 or 2, wherein the process-gas supplying mechanism is adapted to supply a plurality of kinds of process gases into the reaction container; and the flow-rate parameter is at least one of a total flow rate and a proportion of flow rates of the plurality of kinds of process gases.
5. (Previously Presented) A thermal processing unit according to claim 1 or 2, wherein the flow-rate-parameter table-data are made based on experimental data showing relationship between the number-data of the substrates to be processed by one batch-process and the target-data of flow-rate parameter of the process gas.
6. (Original) A thermal processing unit according to claim 5, wherein the flow-rate-parameter table-data are made by interpolating the experimental data showing relationship between the number-data of the substrates to be processed by one batch-process and the target-data of flow-rate parameter of the process gas.
7. (Previously Presented) A thermal processing unit according to claim 1 or 2, wherein the heating mechanism has a plurality of heating units which correspond to a plurality of zones in the processing container;

a temperature table-data storing part that stores temperature table-data associating the number-data of the substrates to be processed by one batch-process with target-data of temperature of the respective zones is provided; and

the controlling part is adapted to obtain target-data of temperature of the respective zones, depending on the actual number of the substrates to be processed by one batch-process, based on the temperature table-data stored in the temperature table-data storing part, and to control the heating units according to the obtained target-data.

8. (Canceled).

9. (Previously Presented) A thermal processing unit according to claim 1 or 2, further comprising

an adjusting unit that adjusts a flow rate of the process gas based on both the film-forming speed and a change of the film-forming speed per unit flow rate of the process gas, when the film-forming speed is out of a predetermined allowable range.

10. (Original) A thermal processing method using a thermal processing unit including:

a holder that holds a plurality of substrates;

a reaction container into which the holder is conveyed;

a process-gas supplying mechanism that supplies a process gas into the reaction container; and

a heating mechanism that heats the reaction container to conduct a film-forming process to the substrates when the process gas is supplied;

the thermal processing method comprising:

a step of obtaining target-data of flow-rate parameter of the process gas, depending on an actual number of the substrates to be processed by one batch-process, based on flow-rate-parameter table-data associating number-data of the substrates to be processed by one batch-process with target-data of flow-rate parameter of the process gas; and

a step of controlling the process-gas supplying mechanism according to the obtained target-data of flow-rate parameter of the process gas;

wherein the target-data of flow-rate parameter are determined in such a manner that a speed of the film-forming process is uniform among a plurality of batch-processes in which the numbers of substrates to be processed are different from each other.

11. (Original) A thermal processing method according to claim 10, wherein the difference between a minimum value and a maximum value of average film-thicknesses of thin films formed on the substrates by the respective batch-processes divided by respective processing times is 0.05 nm/min.

12. (Original) A thermal processing method according to claim 10 or 11, wherein the heating mechanism has a plurality of heating units which correspond to a plurality of zones in the processing container,

the thermal processing method further comprises:

a step of obtaining target-data of temperature of the respective zones, depending on the actual number of the substrates to be processed by one batch-process, based on temperature table-data associating the number-data of the substrates to be processed by one batch-process with target-data of temperature of the respective zones; and

a step of controlling the heating units according to the obtained target-data of temperature of the respective zones.
